Charakteristics: Polyisocyanate-curing acrylic resin

Supplied as:
 A = 60% in shellsol A
 B = 60% in xylene

Use: 2-pack coatings which are air- and oven-drying in combination with aliphatic polyisocyanates, for industrial coatings offering good mechanical properties plus resistance to chemical attack and weathering.

Properties:

	A	B
<u>hydroxyl value</u> (in-house method AV-F-H003)	80-100	80-100
<u>hydroxyl content</u> (relative to nvc)	ca. 2.6%	ca 2.6%
<u>flow time in sec.</u> A (50% in Shellsol A) (in-house method AV-F-V003)	50-60	---
<u>viscosity in mPas</u> (as supplied) (in-house method AV-F-V005)	----	1300-2300
<u>Gardner colour value</u> A (50% in Shellsol A) B (as supplied) (in-house method AV-F-F007)	< 2	< 2
<u>non-volatile content</u> (as supplied) (in-house method AV-F-F003)	60 +/- 1%	60 +/- 1%
<u>flash point in °C</u> (as supplied) (in-house method AV-F-F006)	ca. 40	ca. 24
<u>density in g/ml</u> (as supplied) (in-house method AV-F-D001)	0.983	1.01

Pigmentation:

Any neutral pigments or fillers are suitable for pigmentation. Basic pigments and pigments containing soluble metal compounds may have a catalytic effect on curing and shorten the pot life of coating batches once mixed.

Mixing ratio with poly-isocyanates:

Based on an equivalent reaction of the reactive groups (NCO : OH = 1 : 1) the formula below calculates the quantity of polyisocyanate to be added, relative to 100 pts/wt solid Synthalat A 077:

$$\frac{42 \times 100 \times 2.6}{17 \times \text{NCO\%}}$$

42	=	molecular weight of NCO groups
17	=	molecular weight of OH groups
2.6	=	% hydroxyl content of Synthalat-A 077, relative to non-volatile content
